

The compact and portable Suitcase satellite terminal is easily made compatible with the IATA weight and size concept. With the IATA transport cases the Suitcase can be transported as ordinary luggage on commercial flights.

**SMART PACKAGING**

By dividing the Suitcase terminal into two parts, it can easily be stowed in the specially designed IATA transport cases. One transport case contains the lid and antenna segments and one the base unit. The power supply unit is stowed in a separate IATA case.

**EASY TRANSPORTATION**

The airline checkable IATA transport cases can be stacked on top of each other for easy handling and storage. Detachable wheels facilitates transporting the cases prior to checking in.

**STURDY CONSTRUCTION**

The IATA transport cases are constructed with a robust and lightweight aluminum frame. The sturdy IATA compatible transport cases have ESD foam on the inside to protect from static electricity. The cases protect the Suitcase from rough handling at airports and by shipping firms.
